patch: remove one submission (−75)

- **VKMARK-PSR** present semaphore re-signalled too early
- **VKMARK-CLR** clear not chained to the acquire wait
- **GST-IA** image made visible to the wrong reads
- **VKMARK-ACQ** acquire semaphore reused too early
- **VKMARK-DEPTH** depth image shared, colour-only sync
- **IMGUI-PRE** swapchain images transitioned before acquire
- **VKMARK-UBO** host rewrites a uniform buffer in use
- **GST-WAIT** acquire wait at bottom of pipe blocks nothing
- **SDL-1** host rewrites vertex buffers in use

After the patches, all 15 programs: **no synchronization diagnostic** in either capture mode, no synchronization-validation message, no model warning, and **guarantee-eligible** in the verified configuration; re-tracing each three more times gives the same result.
